

Ubuntu Bridge Initiative · Cybersecurity Internship · Cohort 1 · Stage 3 Capstone

Editable template — Deliverable 2 of 5: The incident timeline. You reconstruct what happened, in order, one event per row, every row tied to a source line. Edit in Google Docs or Microsoft Word (keep it as a table). Replace every [BRACKETED] prompt and delete every grey guidance line before you submit.

Deliverable 2 — The incident timeline

Before you start

- The timeline is built from the logs, not from memory. Your sources are 03-syslog.txt, 04-siem-export.csv, 06-netflow.csv, and the 01-process-listing.txt start times.
- One event per row, in strict UTC chronological order. Every row must name the source file and the exact line (a grep line, a PID, or a CSV row) that proves it.
- Cover the whole arc: **initial access !' privilege escalation !' persistence !' command-and-control !' lateral movement !' exfiltration attempt !' containment**. A timeline that stops at "they got in" is incomplete.
- **Handle lateral movement honestly.** 06-netflow.csv contains unrelated background and lateral flows (SMB/RDP/Postgres) from *other* hosts. If you cannot evidence lateral movement *from* 10.0.1.87, say so — "no lateral movement confirmed from this host; the 445/3389/5432 flows originate from other hosts" is the correct, full-credit answer. Do not invent it, and do not attribute another host's flow to this incident.

This is a scaffold, not an answer key. Every timestamp, event, and evidence cell is yours to fill from the logs.

What you submit

A document (incident-timeline) containing one table, in UTC order, covering the full kill chain on host 10.0.1.87.

First line of your document:

Stage 3 · Incident timeline · [Your Full Name] · [UBI-2026-####]

The timeline table

Timestamp (UTC)	Phase	Event	Source file	Evidence (grep line / PID / row)
[YYYY-MM-DDThh:mm:ssZ]	Initial access	[what happened]	[`03-syslog.txt` / `04-siem-export.csv`]	[quote the line]
[]	Privilege escalation	[]	[]	[]
[]	Persistence	[]	[]	[]
[]	Command & control	[]	[]	[]

[]	Lateral movement	[what you can evidence — or "none confirmed from this host"]	[`06-netflow.csv`]	[the line, or your reasoning that the lateral flows are other hosts]
[]	Exfiltration attempt	[]	[]	[]
[]	Containment	[]	[]	[]

Add rows as your reconstruction needs — but every row is load-bearing and cited. Do not pad with background noise. Keep the columns exactly.

Two-line narrative (optional but rewarded)

[After the table, 2–3 sentences linking the rows into one story: how initial access led to root, how root was made to persist, and how the data left. This shows you understand it as a chain, not a list.]

Where the marks are won (what we look for)

- **Strict chronological order** with real UTC timestamps copied from the logs — not approximations.
- **Every row cited** to a specific source line. A row with no evidence cell is cut.
- **All phases present** — initial access through containment. The exfiltration and containment rows are the ones weak timelines miss.
- **Correct attribution** — events on `10.0.1.87` tied to the attacker, with unrelated/background netflow rows left out (or explicitly marked as not part of this incident).

Before you submit, confirm

- [] First line is the Stage 3 · Incident timeline · Name · Code identity line.
- [] Rows are in strict UTC order and every row names a source file + line.
- [] All six phases are covered, including exfiltration attempt and containment.
- [] No unrelated background/lateral flows attributed to this incident.
- [] No [BRACKETED] prompts or grey guidance lines remain.
